

ASSET RISK PRIORITIZATION IN CRITICAL INFRASTRUCTURE (CI)

In CI, prioritizing asset risk is a component of Enterprise Asset Management whose objective is to categorize ICS/OT assets in two dimensions:

- 1) the criticality of assets under study for the operations of an organization AND
- 2) the potential exposure of those assets to cybersecurity risk.

The risk-based prioritization of industrial assets is important in determining improvements, maintenance, projects, and related investments.

For further information, pls talk to PBOSecure team of experts with many years of experience in this ICS/OT field.
